

Directional couplers

Description and purpose

Directional couplers developed by Micran are two-channel devices designed to tap partial power of high-frequency signal from primary channel to secondary channel. NO15 directional couplers are used to divide incident and reflected waves. NO16 directional coupler design is based on shifted connected strip line. They are used, for example, in automatic working stations to control power level. Materials and design of directional couplers provide high stability of parameters for a great number of connect/disconnect cycles.

NOTE

* VSWR of coupled port is not standardized.

NO16-0.5-20-12R-12R, NO16-0.5-26-03R-03R and NO16-0.5-26-13R-13R models are supplied without matched loads required for normal operation of the coupler. When ordering these models, order the appropriate matched load of NS3-20 series.
